GEEPLUS ADD MOULDING TO THEIR MANUFACTURING SKILLS

Constantly seeking means and methods of improving the quality of their products, especially in those areas where they are able to control the manufacturing process, Geeplus have invested in a moulding machine for the production of plastic parts used initially in their voice coil motors.

By adding new tooling as required, Geeplus is able to control both the quality and quantity of the components required in order to offer customers both economy of scale and more flexibility in delivery times. Following the coil-winding process which is also an in-house facility, the coils are then moulded on to the shaft ready for assembly. This latest addition to their manufacturing capabilities now gives Geeplus the opportunity to mould, wind, clean, hone, magnetise, test and bring it all together with cleanroom assembly all under one roof.
