GEEPLUS ANNOUNCE NEW OVERMOULDING FACILITY

October 2015. Continued investment in the provision of manufacturing facilities which improve product design and quality, Geeplus are pleased to announce that they now have an in-house overmoulding facility.

In addition to winding their own coils, Geeplus are now able to overmould the coils used in their voice coil motors. Using advanced polymers, the coils are encased in a very thin wall of material which enables good coil packing and a very mechanically robust assembly. Creating a high temperature capability of more than 150°C the process also enables greater flexibility with the use of different shafts and overall better performance.
